

**IN THE CLAIMS:**

Please amend the claims as follows:

1. (Original) A composition comprising a mixture of at least one monomer with the formula:

and at least one monomer with the formula:

where monomers of formula (1) are polymerisable with monomers of formula (2), n and m are integers greater than or equal to 2, such that n and m may be the same or different, X is a group containing a terminal thiol, Y is a group containing a reactive unsaturated carbon-carbon bond, each X may be the same or different, each Y may be the same or different, and A and B are molecular fragments such that at least one of A or B is an organic charge-transporting or organic light-emitting fragment.

2. (Original) A composition according to claim 1, wherein  $n + m > 4$ .

3. (Currently Amended) A composition according to ~~any preceding~~ claim 1, wherein A, B, X, and Y do not contain any carbonyl groups.

4. (Currently Amended) A composition according to ~~any preceding~~ claim 1, wherein at least one of A and B is a hole-transporting molecular fragment.

5. (Currently Amended) A composition according to ~~any one of claims~~ claim 1 to 3, wherein at least one of A and B is an electron-transporting molecular fragment.

6. (Currently Amended) A composition according to ~~any one of claims~~ claim 1 to 3, wherein at least one of A and B is a bipolar-transporting molecular fragment.

7. (Currently Amended) A composition according to ~~any one of claims~~ claim 1 to 3, wherein at least one of A and B is a luminescent molecular fragment.

8. (Currently Amended) A composition according to ~~any preceding~~ claim 1, ~~which also comprises~~ further comprising at least one of an initiator ~~and/or~~, an emissive dopant ~~and/or~~, and a charge transporting dopant.

9. (Currently Amended) A composition according to ~~any one of claims~~ claim 1 to 8, wherein A in the monomer of the formula 1 comprises a group of the formula

wherein Ar is an optionally-substituted aromatic group and each of Ar<sub>1</sub>, Ar<sub>2</sub>, Ar<sub>3</sub> and Ar<sub>4</sub> is, independently, an optionally-substituted aromatic or optionally-substituted

heteroaromatic group and Ar<sub>1</sub> and Ar<sub>2</sub> and/or Ar<sub>3</sub> and Ar<sub>4</sub> may, optionally, be linked together to form, with the N atom to which they are attached, a N-containing ring, wherein at least two of Ar<sub>1</sub>, Ar<sub>2</sub>, Ar<sub>3</sub> and Ar<sub>4</sub> are bonded, optionally via a spacer unit, to the group X.

10. (Original) A composition according to claim 9, wherein A in the monomer of the formula 1 comprises at least one group of the formula

11. (Original) A composition according to claim 10, wherein the monomer of the formula I has the formula

where Q<sub>1</sub> is

12. (Currently Amended) A composition according to ~~any one of claims~~ claim 1 to 11, wherein B in the monomer of the formula 2 comprises a group of the formula

wherein Ar is an optionally-substituted aromatic group and each of Ar<sub>1</sub>, Ar<sub>2</sub>, Ar<sub>3</sub> and Ar<sub>4</sub> is, independently, an optionally-substituted aromatic or optionally-substituted heteroaromatic group and Ar<sub>1</sub> and Ar<sub>2</sub> and/or Ar<sub>3</sub> and Ar<sub>4</sub> may, optionally, be linked together to form, with the N atom to which they are attached, a N-containing ring, wherein at least two of Ar<sub>1</sub>, Ar<sub>2</sub>, Ar<sub>3</sub> and Ar<sub>4</sub> are bonded, optionally via a spacer unit, to the group Y.

13. (Original) A composition according to claim 12, wherein B in the monomer of the formula 2 comprises at least one group of the formula

14. (Original) A composition according to claim 13, wherein the monomer of the formula 2 has the formula

wherein  $Q_2$  is

15. (Currently Amended) A composition according to ~~any one of claims~~ claim 9, 10, 12 or 13 wherein Ar comprises biphenyl.

16. (Currently Amended) A solid film comprising a thermally-induced or radiation-induced polymerisation reaction product of a composition according to ~~any one of claims~~ claim 1 to 15.

17. (Currently Amended) A solid film comprising a radiation-induced polymerisation reaction product of a composition according to ~~any one of claims~~ claim 1 to 15 that has a pre-determined pattern.

18. (Currently Amended) A solid film comprising a polymer with repeat unit

where A and B are ~~as defined above~~ molecular fragments such that at least one of A or B is an organic charge-transporter or organic light-emitting fragment, Z is the

addition product of the a thiol-containing group[,] X[,] and the a group Y containing a reactive unsaturated carbon-carbon bond, Y, and W is the addition product of the group Y containing a reactive unsaturated carbon-carbon bond, Y and the thiol-containing group[,] X.

19. (Currently Amended) An organic light emitting device comprising laminated in sequence a substrate, an electrode, a first optional charge transporting layer, an emissive layer, a second optional charge transporting layer and a counter electrode wherein at least one of the emissive layer, the first optional charge transporting layer or the second optional charge transporting layer is a film according to ~~any one of claims~~ claim 16 ~~to 18~~.

20. (Currently Amended) An organic light emitting device comprising laminated in sequence a substrate, an electrode, a first optional charge transporting layer, an emissive layer, a second optional charge transporting layer and a counter electrode wherein the emissive layer is a film according to ~~any one of claims~~ claim 16 ~~to 18~~.

21. (Currently Amended) A device as in ~~either claim 19 or claim 20~~, wherein the light emitting layer contains an emissive dopant.

22. (Currently Amended) A process for forming a device as claimed in ~~any one of claims~~ claim 19 ~~to 21~~ that comprises the steps of:

i) depositing a film of a composition ~~claimed in any one of claims 1 to 14~~ comprising a mixture of at least one monomer with the formula:

A-(X)<sub>n</sub> (1)

and at least one monomer with the formula:

B-(Y)<sub>m</sub> (2)

where monomers of formula (1) are polymerisable with monomers of formula (2), n and m are integers greater than or equal to 2, such that n and m may be the same or different, X is a group containing a terminal thiol, Y is a group containing a reactive unsaturated carbon-carbon bond, each X may be the same or different, each Y may be the same or different, and A and B are molecular fragments such that at least one of A or B is an organic charge-transporting or organic light-emitting fragment; and

ii) polymerising said composition.

23. (Currently Amended) A process according to claim 22 ~~wherein,~~  
comprising exposing at least portions of the film of said composition ~~are exposed to~~  
actinic radiation to polymerise the corresponding portions of the film.

24. (Currently Amended) A process according to claim 23 ~~wherein,~~  
comprising exposing the film ~~is exposed to~~ actinic radiation through a mask and then  
developing the film ~~is then developed to~~ remove the unexposed portions of the film.

25. (Currently Amended) A process for forming a device as claimed in  
~~either claim 20 or claim 21~~ that comprises the steps of:

i) depositing a film of a composition ~~elaimed in any one of claims 1 to 15~~ that  
is capable of emitting light of a first colour said composition comprising a mixture of  
at least one monomer with the formula:

and at least one monomer with the formula:

where monomers of formula (1) are polymerisable with monomers of formula (2), n and m are integers greater than or equal to 2, such that n and m may be the same or different, X is a group containing a terminal thiol, Y is a group containing a reactive unsaturated carbon-carbon bond, each X may be the same or different, each Y may be the same or different, and A and B are molecular fragments such that at least one of A or B is an organic charge-transporting or organic light-emitting fragment;

ii) exposing portions of said film to actinic radiation through a mask to polymerise the corresponding portions of the film;

iii) removing unexposed portions of said film to leave a pre-determined pattern;

iv) depositing a film of [a] said composition ~~elaimed in any one of claims 1 to 15~~ that is capable of emitting light of a second colour; and

v) exposing portions of said second colour film to actinic radiation through a mask to polymerise the corresponding portions of the film.

26. (New) A composition according to claim 12, wherein Ar comprises biphenyl.

27. (New) A device as in claim 20, wherein the light emitting layer contains an emissive dopant.

28. (New) An organic light emitting device comprising laminated in sequence a substrate, an electrode, a first optional charge transporting layer, an emissive layer, a second optional charge transporting layer and a counter electrode wherein at least one of the emissive layer, the first optional charge transporting layer or the second optional charge transporting layer is a film according to claim 17.

29. (New) A device as in claim 28, wherein the light emitting layer contains an emissive dopant.

30. (New) An organic light emitting device comprising laminated in sequence a substrate, an electrode, a first optional charge transporting layer, an emissive layer, a second optional charge transporting layer and a counter electrode wherein at least one of the emissive layer, the first optional charge transporting layer or the second optional charge transporting layer is a film according to claim 18.

31. (New) A device as in claim 30, wherein the light emitting layer contains an emissive dopant.

32. (New) An organic light emitting device comprising laminated in sequence a substrate, an electrode, a first optional charge transporting layer, an emissive layer, a second optional charge transporting layer and a counter electrode wherein the emissive layer is a film according to 17.

33. (New) A device as in claim 32, wherein the light emitting layer contains an emissive dopant.

34. (New) An organic light emitting device comprising laminated in sequence a substrate, an electrode, a first optional charge transporting layer, an emissive layer, a second optional charge transporting layer and a counter electrode wherein the emissive layer is a film according to claim 18.

35. (New) A device as in claim 34, wherein the light emitting layer contains an emissive dopant.

36. (New) A process for forming a device as claimed in claim 20 that comprises the steps of:

i) depositing a film of a composition comprising a mixture of at least one monomer with the formula:

and at least one monomer with the formula:

where monomers of formula (1) are polymerisable with monomers of formula (2), n and m are integers greater than or equal to 2, such that n and m may be the same or different, X is a group containing a terminal thiol, Y is a group containing a reactive unsaturated carbon-carbon bond, each X may be the same or different, each Y may be the same or different, and A and B are molecular fragments such that at least one of A or B is an organic charge-transporting or organic light-emitting fragment; and

ii) polymerising said composition.

37. (New) A process according to claim 36, comprising exposing at least portions of the film of said composition to actinic radiation to polymerise the corresponding portions of the film.

38. (New) A process according to claim 37, comprising exposing the film to actinic radiation through a mask and then developing the film to remove the unexposed portions of the film.
